Information Disclosure Statement

Commissioner of Patents and Trademarks Washington, District of Columbia 20231

Sir:

Attached is a completed Form PTO-1449 and copies of the pertinent parts of the references cited thereon. Following are comments on these references pursuant to Rule 98:

Patents which describe systems that monitor voltage and/or current waveforms generated by arcing or discharge fault events are:

Biskeborn, U.S. Pat No 2,493,800, 1950, Weintraub, U.S. Pat No 2,717,992, 1955, Biskip, U.S. Pat No 3,462,681, 1969

Patent to Pardis, U.S. Patent No. 3,609,533, 1971, describes a fault location system which utilizes a high energy pulse transmitted on the network under test

Patent to Maureira, U.S. Pat No 5,416,418, 1995, describes application in lower voltage, (ie. 6kV to 33kV), distribution cables, and focuses on partial discharge events using a pulse transmission technique as a reference/timing signal.

Patent to Bjorklund, 5,903,155 describes the same fundamental process that Biskeborn, Weintraub, Biskip, Pardis and Maureira use.

Patent to Wright et al 4,499,417 describes a single ended system that uses the disturbance created by the fault and subsequent reflections.

Patent t Bunch 4,570,231 describes the same

fundamental process that Biskeborn, Weintraub, Biskip, Pardis and Maureira uses.

Patent to Burnett 5,243,294 discloses a complex system for determining the likelihood of a physical anomaly in an elongate, electrically conductive member, such as an oil or gas pipeline. The technique is based on sending two pulses from either end of the physical body to be evaluated.

Patent to Bellis et al 4,491,782 describes improvement to Time Domain Reflectometry, also known as Pulse Echo. This patent is targeted to unstable, transitory faults, as well as stable faults in energized power cable.

Patent to Walsh 5,382,910 describes improvement to Time Domain Reflectometry by canceling out the blind spot or dead zone inherent in any TDR system during the transmission of the test pulse.

Patent to Oberg et al. 5,751,149 describes improvement to Time Domain Reflectometry by implementing a very high and adjustable frequency transmit pulse to allow frequency sensitive faults to be more visible to the TDR.

Patent to Westwood 5,514,965 describes improvement to Time Domain Reflectometry by using new technology, a digital, programmable delay generator device as a TDR timebase to improve resolution of fault reflections.

HILLER

SINCERELY.
